Vision Metering™

Manpower shortages?   O&M Budget shortfalls?

Let us cure your meter testing headaches!

Vision Metering began providing meter testing services over 26 years ago. Since then we have grown to become the largest meter testing facility in the United States.

As the metering industry continues to evolve, new testing demands are placed on utility meter labs. Reduced manpower, shrinking budgets and additional testing requirements for AMI meters can quickly place a utility in a position that is difficult to handle without assistance.

Vision Metering offers a number of different meter testing programs aimed to ease your meter testing workload. These range from one time testing help to full or partial outsourcing of your meter testing. Our most popular service program consists of outsourcing your high volume residential meter testing while maintaining your lower volume, high revenue C&I metering in-house. We specialize in customizing a program to fit every utility's individual requirements.

AMI metering adds many new complications to a typical meter shop workflow. In addition to the normal accuracy testing, AMI meters also require communication testing, remote disconnect testing and often firmware upgrades before meters can be returned to service. Vision Metering has experience working with most existing AMI communication systems and works well with AMI vendor to incorporate communication testing and firmware testing into a utility's testing program.

Our highly trained workforce is standing by to help with any meters testing needs from a few hundred meters to tens of thousands. Contact us today and let us develop a custom tailored testing program that meets all of YOUR testing needs.

Services include:

Meter testing

Retirement testing

Acceptance testing

AMI Communication testing

RMA processing

Certified Smart Meter Destruction

AMI Integration

Overflow testing

Partial Outsourcing

Full outsourcing
